DETAILED ACTION

Allowable Subject Matter

1. Claims 17, 18, 20-25, 28, 30, 31, and 33-40 are allowed.
2. The following is an examiner's statement of reasons for allowance: The prior art fails to teach or render obvious the invention as essentially claimed.
3. Haas (U.S. Pat. No. 1,331,707) and Rado (U.S. Pub. No. 2004/0074985) were considered most pertinent to applicant's disclosure.

Haas disclose a valve (fig. 2) comprising: a valve body (1,3) defining an inlet (16), an outlet (11), and a seat (7) a first port (30); a first valve member (42, 43, 44, 25) moveable between a first valve member closed position (against seat 7) and a first valve member open position (away from seat 7), wherein at least a portion (42) of the first valve member is in contact with the seat (7) when the first valve member is in the first valve member closed position, and the at least a portion (42) of the first valve member is spaced a predetermined distance from the seat (7) when the first valve member is in the first valve member open position; an actuator (41, 39), wherein at least a portion (41) of the actuator (41,39) is moveable relative to the valve body (1,3); wherein the first valve member (42, 43, 44, 25) is further defined by an axial cavity (within 60) in fluid communication with the inlet (16), the valve body (1,3) is further defined by a low pressure chamber portion (10, 33) and a high pressure chamber portion (15, 29), the high pressure chamber (15, 29) being formed in part by the axial cavity (within 60), the first valve member (42, 43, 44, 25), when in the first valve member closed position, defines a first boundary between the low pressure chamber

(10, 33) and the high pressure chamber (15, 29), and wherein the low pressure chamber (10, 33) is in fluid communication with the high pressure chamber (15, 29) when the first valve member (42, 43, 44, 25) is in the first valve member open position; a second valve member/needle (38) coupled to the actuator (41,39) and being movable between a open position and a closed position, wherein at least a portion of the second valve member/needle (38) is in contact with at least a portion of the first port (30) when the second valve member/needle (38) is in the closed position, thereby defining a second boundary between the low pressure chamber (10, 33) and the high pressure chamber (15, 29); a restriction part (22) located in the high pressure chamber (15, 29) and having a restriction passageway (24) which allows the passage of fluid from one side of the restriction part to another side of the restriction part, both sides of the restriction passageway being located in the high pressure chamber (15, 29), wherein the restriction part (22) remains stationary as the first valve member (42, 43, 44, 25) moves from the closed position to the open position. However, Haas does not disclose the piezoelectric portion and wherein the valve is in an automotive fluid system and wherein the pressure differential across the restriction passageway creates a change in pressure in the axial cavity (defined by 60 in Haas) causing the first valve member to move. Haas in contrast uses the difference in pressure created by opening the relief valve (38) to move the first valve member. Rado teaches the use of a piezoelectric portion, however does not overcome the deficiencies of Haas's restriction.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably

accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
